The Properties of Water. Water is the most abundant compound on Earth's surface. In nature, water exists in the liquid, solid, and gaseous states. It is in dynamic equilibrium between the liquid and gas states at 0 degrees Celsius and 1 atm of pressure. At room temperature (approximately 25 degrees Celsius), it is a tasteless, odorless, and colorless liquid.

Figure 15.1.2: Water is a polar molecule, as greater electron density is found around the more electronegative oxygen atom. Polar molecules attract one another by dipole-dipole forces as the positive end of one molecule is attracted to the negative end of the nearby molecule. In the case of water, the highly polar O-H bonds results in ...

15.1: Structure of Water - Chemistry LibreTexts

Water is colorless and tasteless liquid. The molecules of water have extensive hydrogen bonds resulting to unusual properties in the condensed form. This also leads to high melting and boiling points. As compared to other liquids, water has a higher specific heat, thermal conductivity, surface tension, dipole moment etc.

What Are the 5 Emergent Properties of Water? | Sciencing

Water is a polar molecule that has a high level of polarity and attraction to ions and other polar molecules. Water can form hydrogen bonds, which make it a powerful solvent. Water molecules are attracted to other molecules that contain a full charge, like an ion, a partial charge, or polar. Salt (Na^+ Cl^-) dissolves in water.
