Series Circuits When charge has only one complete path to follow, the current, I , is the same everywhere. This is a series circuit. A break anywhere stops all current from flowing. From Ohm's law: $I = V / R$ we can calculate the current, I , in the circuit. The equivalent Resistance, R

Series-Parallel Circuits • Series-Parallel circuits can be more complex as in this case: In circuit (a) we have our original complex circuit. In circuit (b) we have resistors R 1 and R 2 combined to get 13.2Ω . R 4 is in series with the newly combined R 12 and their added value is 51.2Ω . And now (c) we are left with R 124 in parallel with R 3.
