incorporate active multispectral detection and are capable of providing greatly enhanced imaging performance using very low-cost fabrication techniques. Our MEMS-less pyroelectric sensor employs an active detection mechanism based on a strontium bismuth tantalate (SBT) ferroelectric sensing material.

Active Mode Detection with Enhanced Pyroelectric Sensitivity

A MEMS-less infrared pyroelectric sensor that employs an active detection mechanism based on a strontium bismuth tantalate ($\text{SrBi}_2\text{Ta}_2\text{O}_9$) ferroelectric sensing material is described and compared to passive modes of operation. A model is based on fundamental performance of ferroelectrics in which the polarization state of the material is actively interrogated enabling improved signal to noise ratio, greater effective pyroelectric coefficient, and chopper-less design.

Detect mode represents a creature actively trying to find something that is hidden, using the listen, search, and spot skills. (When not using this mode, a creature is considered to be passively noticing things that are hidden, represented by halving their detection skills.) It is not possible to run in this mode, and if combined with other situations that prohibit running, the creature's ...

Surface-enhanced Raman spectroscopy or surface-enhanced Raman scattering (SERS) is a surface-sensitive technique that enhances Raman scattering by molecules adsorbed on rough metal surfaces or by nanostructures such as plasmonic-magnetic silica nanotubes. The enhancement factor can be as much as 10^{10} to 10^{11} , which means the technique may detect single molecules.
