The angle formed by the intersection of 2 tangents, 2 secants or 1 tangent and 1 secant outside the circle equals half the difference of the intercepted arcs! Therefore to find this angle (angle K in the examples below), all that you have to do is take the far intercepted arc and near the smaller intercepted arc and then divide that number by two!

Tangent, secants, their arcs, and angles--Formula ...

An angle formed by a chord (link) and a tangent (link) that intersect on a circle is half the measure of the intercepted arc. $x = \frac{1}{2} \cdot m \widehat{ABC}$ Note: Like inscribed angles, when the vertex is on the circle itself, the angle formed is half the measure of the intercepted arc.

Radius: The distance from the center of the circle to its outer rim.

Chord: A line segment whose endpoints are on a circle.

Diameter: A chord that passes through the center of the circle.

Secant: Intersects the circle in 2 places; Tangent: intersects with the circle in one place, forms a right angle when connected to a radius or diameter.
