Network Management Mibs And Mpls

Network Management, MIBs and MPLS: Principles, Design and Implementation makes such management possible. Widely-experienced engineer and network management specialist Stephen Morris discusses how, the skillful use of MIBs (management information bases) and network management system (NMS) technology, can be used to help solve some of the management problems associated with running large footprint enterprise and service provider networks.

As mentioned earlier, the MIB defines managed objects in a conceptual way, including the syntax and semantic information about each object. These managed objects can then be instantiated as real objects in an agent host device. Figure 2-5 is an extract from one of the draft MPLS MIBs [IETF-TE-MPLS] taken from the IETF Web site.

The deployed network management system (NMS) is a critical element in realizing ROI and is used to support the five major network management functional areas. In many cases, more than one system is needed to realize the overall NMS capability. The five functional areas of network management for MPLS are known by the acronym FCAPS: Fault.

MPLS Traffic Engineering MIB. The MPLS Traffic Engineering MIB enables Simple Network Management Protocol (SNMP) agent support in Cisco software for Multiprotocol Label Switching (MPLS) traffic engineering (TE) management, as implemented in the MPLS Traffic Engineering MIB (MPLS TE MIB). The SNMP agent code operating with the MPLS TE MIB enables a standardized, SNMP-based approach to be used in managing the MPLS TE features in Cisco software.
