Provided that uncertainty in forensic evidence should be measured by means of probability, the Bayesian approach represents the ideal solution for both inference and decision. This contribution aims to illustrate how this perspective operates in age estimation from both theoretical and operational points of view.

Statistics works on collecting lot of data to be able to generate insights and drive decision making. Statistics includes but is not limited to the study of probability models only. There are many discussions on StackOverflow , however, I would like to conclude that it is an iterative process to understand the foundations of probability enough to understand the central dogma of statistics.
