In geometry, two figures or objects are congruent if they have the same shape and size, or if one has the same shape and size as the mirror image of the other. More formally, two sets of points are called congruent if, and only if, one can be transformed into the other by an isometry, i.e., a combination of rigid motions, namely a translation, a rotation, and a reflection.

Transitivity principle for indirect measurement. If the length of object A is greater than the length of object B, and the length of object B is greater than the length of object C, then the length of object A is greater than the length of object C. This principle applies to measurement of other quantities as well. Uniform probability model.

In geometry, the word "similar" is used to indicate when two objects have the same shape, but not necessarily the same size. In this lesson, we learn the precise definition of similar polygons, explore the scale factor between two similar polygons, and learn how to use the scale factor to solve problems.
