### The Triune Brain In Evolution

The triune brain is a model of the evolution of the vertebrate forebrain and behavior, proposed by the American physician and neuroscientist Paul D. MacLean.MacLean originally formulated his model in the 1960s and propounded it at length in his 1990 book The Triune Brain in Evolution. The triune brain consists of the reptilian complex, the paleomammalian complex (limbic system), and the ...

### Triune brain - Wikipedia

This is MacLean's major work on the evolutionary development of the human brain. In its evolution the human forebrain expands along the lines of three basic formations that anatomical and biochemically reflect an ancestral relationship, respectively, to reptiles, early mammals, and late mammals. MacLean describes this as the Triune Brain.

The triune brain is a concept that neuroscientist Paul MacLean developed to refer to the three parts of the brain in human beings. These parts develop in different stages of the evolutionary cycle, which is why people say they're created from the bottom up. This means that the oldest, most primitive part of the brain develops in the uterus.

### The Triune Brain - McGill University

In the 1960s, American neuroscientist Paul MacLean formulated the 'Triune Brain' model, which is based on the division of the human brain into three distinct regions. MacLean's model suggests the human brain is organized into a hierarchy, which itself is based on an evolutionary view of brain development. The three regions are as follows:
